

## WallBAR Insulation

WallBAR is blown in cellulose that is specially formulated for vertical application. As a result of the application process, you're left with a superior air, thermal, fire, and noise reduction barrier.

Our dense pack WALLBAR application eliminates wall cavities & air convection within the wall, to provide a warmer, quieter, more comfortable and energy efficient home.

## Benefits

- Wallbar is a licenced product. This ensures a quality install is done every time.
- It thermally and acoustically outperforms glass fibre, rock wool, and spray-foam products.
- It doesn't break down over time; glass fibre has been shown to gradually lose its structure.
- It maintains a higher value of insulating quality (R-value) than the same volume of glass fibre.
- The embodied energy used to produce Wallbar is 10 times less than glass fibre and mineral wool, and 60 times less than spray foam.
- Is proven to increase in R-Value as temperatures decrease.

## Fire Protection

WallBAR stays in place longer than other insulations and will not add more fuel to the fire by melting away. The borates added to WallBAR provide superior flame resistance, and are six times less toxic to humans than common table salt. WallBAR also contains no glass fibre or formaldehyde.

*the Greenest of the Green*  
Cellulose Insulation

WallBAR provides **incredible sound reduction qualities** that are ideal for shared walls.

## Premium Insulation Solution

When WallBAR is installed, the home owner will save up to 50% of their energy cost compared to glass fibre.
